TO THE INSTRUCTOR

The Test Bank has been prepared for the eighth edition of Salas, Hille, and Etgen’s *Calculus: One and Several Variables*. Each chapter is divided into sections that correspond to the sections in the textbook. In all, the Test Bank consists of 2,223 problems, together with their solutions that appear immediately after the end of each chapter. Numerous charts and illustrations have also been drawn where appropriate to strengthen the presentation. Far more items are offered within each chapter than any user of the Test Bank would ordinarily need. Due to differences in rounding, some of the answers requiring calculations by students may differ slightly from the ones given in the Test Bank.

The entire Test Bank has been incorporated into MICROTEST®, a computerized test preparation system, by Delta Software. This software has been designed to retrieve the questions from the Test Bank and print your tests and answer keys using a PC running on Windows 3.1 or higher. The questions on your tests printed by the software will be exact duplicates of those shown here. The software includes a host of powerful features and flexibility for selecting questions and producing multiple versions of tests without your having to retype the items or draw the pictures. To obtain MICROTEST® software for this textbook, please contact your John Wiley sales representative.

I wish to thank Edwin and Shirley Hackleman of Delta Software for their composition and editorial assistance in preparing the hard copy manuscript and Donald Newell of Delta Software for developing and checking the computerized version of the Test Bank. We have endeavored as a team to produce test items that we trust instructors will find a useful supplement to *Calculus: One and Several Variables*.

104. True for \( n = 1 \): \( 3 \leq 3 \). Assume true for \( n \). Then
\[
3(n + 1) = 3n + 3 \leq 3^n + 3 \leq 3^n + 3^n = 2(3^n) < 3(3^n) = 3^{n+1},

Therefore, by induction, it is true for \( n \geq 1 \).

105. True for \( n = 1 \): \( 1 \cdot 2 \cdot 3 \cdot 4 = 3 \cdot 8 \). Assume true for \( n \). Then
\[
(n + 1)(n + 2)(n + 3)(n + 4) = n(n + 1)(n + 2)(n + 3) + 4(n + 1)(n + 2)(n + 3).
\]
The first term is divisible by 8 by the induction hypothesis, and the second term is divisible by 8 since at least one of \( (n + 1) \), \( (n + 2) \), \( (n + 3) \) is even. Hence the result is true for \( n + 1 \).
Therefore, by induction, it is true for all \( n \geq 1 \).

106. True for \( n = 1 \): \( 1 = 2(1)^2 - 1 \). Assume true for \( n \).
Then
\[
1 + 5 + 9 + \ldots + [4(n + 1) - 3] = 1 + 5 + 9 + \ldots + (4n - 3) + [4(n + 1) - 3] = 2n^2 - n + (4n + 1)
= 2(n + 1)^2 - (n + 1),
\]
so the result is true for \( n + 1 \).
Therefore, by induction, it is true for all \( n \geq 1 \).
